Conservativity

A key notion in the foundations of mathematics is the following.

Definition

Let T be a theory. We say that an extension T^+ of T is *conservative over* T if every statement expressible in the language of T and provable in T^+, is already provable in T.

Conservativity

A key notion in the foundations of mathematics is the following.

Definition

Let T be a theory. We say that an extension T^+ of T is *conservative over* T if every statement expressible in the language of T and provable in T^+, is already provable in T.

Observation

Conservativity implies equiconsistency.

Conservativity of Type Theory over Arithmetic

Theorem (Beeson, 1985)

The first-order fragment of Martin-Löf's type theory* $\mathbf{ML}_0$ *is conservative over Heyting Arithmetic* **HA**.

Daniël Otten and Benno van den Berg. "Conservativity of Type Theory over Higher-Order Arithmetic". In: 32nd EACSL Annual Conference on Computer Science Logic (CSL 2024)

Conservativity of Type Theory over Arithmetic

Theorem (Beeson, 1985)

The first-order fragment of Martin-Löf's type theory* $\mathbf{ML}_0$ *is conservative over Heyting Arithmetic* $\mathbf{HA}$.

*meaning without universes but with the axiom $0 \neq 1$.

Daniël Otten and Benno van den Berg. "Conservativity of Type Theory over Higher-Order Arithmetic". In: 32nd EACSL Annual Conference on Computer Science Logic (CSL 2024)

Conservativity of Type Theory over Arithmetic

Theorem (Beeson, 1985)

The first-order fragment of Martin-Löf's type theory* $\mathbf{ML_0}$ *is conservative over Heyting Arithmetic* **HA**.

*meaning without universes but with the axiom $0 \neq 1$.

Theorem (Otten and van den Berg, 2024)

(An extensional version of) the Calculus of Inductive Constructions **CIC** *is conservative over Higher Order Heyting Arithmetic* **HAH**.

Daniël Otten and Benno van den Berg. "Conservativity of Type Theory over Higher-Order Arithmetic". In: 32nd EACSL Annual Conference on Computer Science Logic (CSL 2024)

Conservativity of Type Theory over Arithmetic

Theorem (Beeson, 1985)

The first-order fragment of Martin-Löf's type theory* $\mathbf{ML}_0$ *is conservative over Heyting Arithmetic* **HA**.

*meaning without universes but with the axiom $0 \neq 1$.

Theorem (Otten and van den Berg, 2024)

(An extensional version of) the Calculus of Inductive Constructions **CIC** *is conservative over Higher Order Heyting Arithmetic* **HAH**.

Goal

Transfer these results to the case of classical logic – in particular replacing **HA** with Peano Arithmetic **PA**.

Daniël Otten and Benno van den Berg. "Conservativity of Type Theory over Higher-Order Arithmetic". In: 32nd EACSL Annual Conference on Computer Science Logic (CSL 2024)

Classical logic in Predicative Foundations

Issue

The classical version $\mathbf{ML}_0^c$ of $\mathbf{ML}_0$ is stronger than **PA** (in fact, even of **PAH**!)

Classical logic in Predicative Foundations

Issue

The classical version $\mathbf{ML}_0^c$ of $\mathbf{ML}_0$ is stronger than **PA** (in fact, even of **PAH**!)

From a proof-theoretic perspective, classical logic interacts poorly with most predicative foundations, e.g.

- Homotopy Type Theory
- Constructive Zermelo-Fraenkel set theory

Classical logic in Predicative Foundations

Issue

The classical version $\mathbf{ML}_0^c$ of $\mathbf{ML}_0$ is stronger than **PA** (in fact, even of **PAH**!)

From a proof-theoretic perspective, classical logic interacts poorly with most predicative foundations, e.g.

- Homotopy Type Theory
- Constructive Zermelo-Fraenkel set theory

If we want to obtain a classical version of Beeson's theorem, we need to replace Martin-Löf's type theory with something more appropriate...

The Minimalist Foundation

The *Minimalist Foundation* **MF** is a type theory *compatible* with the most relevant foundations of mathematics.

M. E. Maietti, G. Sambin. "Toward a minimalist foundation for constructive mathematics". 2005

M. E. Maietti. "A minimalist two-level foundation for constructive mathematics". 2009

The Minimalist Foundation

The *Minimalist Foundation* **MF** is a type theory *compatible* with the most relevant foundations of mathematics.

Example

- Martin-Löf's type theory
- Homotopy Type Theory
- Calculus of Inductive Constructions
- Constructive Zermelo-Fraenkel set theory
- Internal language of toposes

A *prop* is a *prop* is a *prop* is a *prop*.

Corollary (to Beeson's theorem)

$\mathbf{MF}_0$ *is conservative over* **HA**.

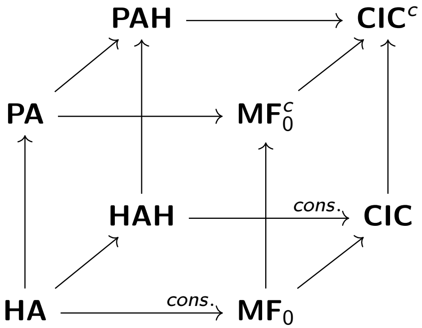
Idea

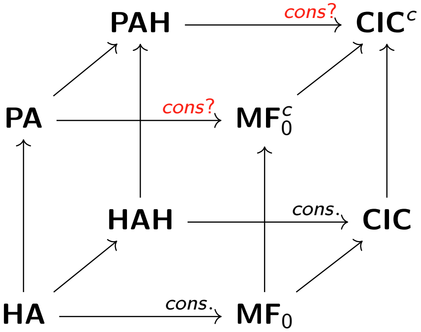
We claim that *this* result can be extended to classical logic.

A cube of theories



- x-axis ($\rightarrow$): add type theory
- y-axis ($\uparrow$): add classical logic
- z-axis ($\nearrow$): add impredicativity

A cube of theories



- x-axis ($\rightarrow$): add type theory
- y-axis ($\uparrow$): add classical logic
- z-axis ($\nearrow$): add impredicativity

The Double-Negation Translation

If φ is an arithmetic formula, let $\varphi^{\mathcal{N}}$ be the formula obtained by prefixing a double-negation $\neg\neg$ in front of each existential quantifier and each disjunction appearing in φ.

The Double-Negation Translation

If φ is an arithmetic formula, let $\varphi^{\mathcal{N}}$ be the formula obtained by prefixing a double-negation $\neg\neg$ in front of each existential quantifier and each disjunction appearing in φ.

Theorem (Gödel, 1933)

$\mathbf{PA} \vdash \varphi$ *if and only if* $\mathbf{HA} \vdash \varphi^{\mathcal{N}}$.

The Double-Negation Translation

If φ is an arithmetic formula, let $\varphi^{\mathcal{N}}$ be the formula obtained by prefixing a double-negation $\neg\neg$ in front of each existential quantifier and each disjunction appearing in φ.

Theorem (Gödel, 1933)

PA $\vdash \varphi$ *if and only if* **HA** $\vdash \varphi^{\mathcal{N}}$*.*

The result is readily extended to higher sorts.

Theorem (Kreisel, 1968)

PAH $\vdash \varphi$ *if and only if* **HAH** $\vdash \varphi^{\mathcal{N}}$*.*

The Challenge

In dependent type theories, logical and set-theoretical constructors are highly intertwined:

- terms appear in formulas through equality $a = b$ (as in predicate logic)
- types appear in formulas as domains of quantification $(\exists x : A)\varphi(x)$
- formulas appear in types as in the quotient set constructor A/R
- formulas appear as terms of a universe $\varphi : \mathbf{Prop}$.

...we need to extend the double-negation translation to every entity!

The double-negation translation for Type Theory

In the case of **MF** and **CIC**, the definition of the translation turns out to be surprisingly simple. The relevant cases are the following.

$$
\begin{aligned}
(\varphi \vee \psi)^{\mathcal{N}} &:\equiv \neg\neg(\varphi^{\mathcal{N}} \vee \psi^{\mathcal{N}}) \\
((\exists x : A)\varphi)^{\mathcal{N}} &:\equiv \neg\neg(\exists x : A^{\mathcal{N}})\varphi^{\mathcal{N}} \\
\mathbf{Prop}^{\mathcal{N}} &:\equiv \sum_{P : \mathbf{Prop}} \neg\neg P \Rightarrow P
\end{aligned}
$$

The double-negation translation for Type Theory

In the case of **MF** and **CIC**, the definition of the translation turns out to be surprisingly simple. The relevant cases are the following.

$$(\varphi \vee \psi)^{\mathcal{N}} :\equiv \neg\neg(\varphi^{\mathcal{N}} \vee \psi^{\mathcal{N}})$$

$$((\exists x : A)\varphi)^{\mathcal{N}} :\equiv \neg\neg(\exists x : A^{\mathcal{N}})\varphi^{\mathcal{N}}$$

$$\mathbf{Prop}^{\mathcal{N}} :\equiv \sum_{P : \mathbf{Prop}} \neg\neg P \Rightarrow P$$

Lemma

For any type A we have that $\neg\neg \mathrm{Eq}_{A^{\mathcal{N}}}(x, y) \Rightarrow \mathrm{Eq}_{A^{\mathcal{N}}}(x, y)$ holds.

In the case of **MF** and **CIC**, the definition of the translation turns out to be surprisingly simple. The relevant cases are the following.

$$(\varphi \vee \psi)^{\mathcal{N}} :\equiv \neg\neg(\varphi^{\mathcal{N}} \vee \psi^{\mathcal{N}})$$
$$((\exists x : A)\varphi)^{\mathcal{N}} :\equiv \neg\neg(\exists x : A^{\mathcal{N}})\varphi^{\mathcal{N}}$$
$$\mathbf{Prop}^{\mathcal{N}} :\equiv \sum_{P\,:\,\mathbf{Prop}} \neg\neg P \Rightarrow P$$

Lemma

For any type A we have that $\neg\neg \mathrm{Eq}_{A^{\mathcal{N}}}(x, y) \Rightarrow \mathrm{Eq}_{A^{\mathcal{N}}}(x, y)$ *holds.*

Theorem (Maietti, S.)

A judgment $\mathcal{J}$ *is derivable in* $\mathbf{MF}^c$ *(resp.* $\mathbf{CIC}^c$*) if and only if* $\mathcal{J}^{\mathcal{N}}$ *is derivable in* **MF** *(resp.* **CIC***).*

Conservativity over Peano Arithemtic

Theorem (Contente, S.)

$\mathbf{MF}_0^c$ *is conservative over* **PA** *and* **CIC** *is conservative over* **PAH**.

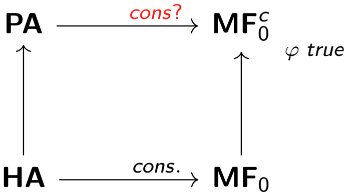
Conservativity over Peano Arithemtic

Theorem (Contente, S.)

*$\mathbf{MF}_0^c$ is conservative over **PA** and **CIC** is conservative over **PAH**.*

Proof.

Let φ be an arithmetical proposition, and assume φ is true in $\mathbf{MF}_0^c$.



$\square$

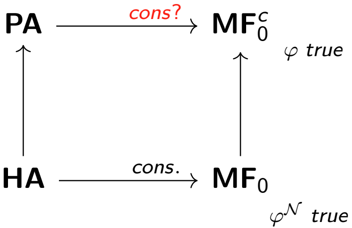
Conservativity over Peano Arithemtic

Theorem (Contente, S.)

$\mathbf{MF}_0^c$ is conservative over **PA** *and* **CIC** *is conservative over* **PAH**.

Proof.

Let φ be an arithmetical proposition, and assume φ is true in $\mathbf{MF}_0^c$.



□

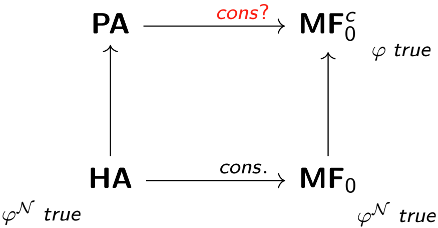
Conservativity over Peano Arithemtic

Theorem (Contente, S.)

$\mathbf{MF}_0^c$ *is conservative over* **PA** *and* **CIC** *is conservative over* **PAH**.

Proof.

Let φ be an arithmetical proposition, and assume φ is true in $\mathbf{MF}_0^c$.



□

Conservativity over Peano Arithemtic

Theorem (Contente, S.)

***MF**$_0^c$ is conservative over **PA** and **CIC** is conservative over **PAH**.*

Proof.

Let φ be an arithmetical proposition, and assume φ is true in **MF**$_0^c$.
